video1

- Mini game development pipeline, outlines upcoming topics regarding mindset, folder structure, documentation, and assets.

- Useful idea: The lack of a secure growth mindset can often bring about more problems regardless of technical prowess, hence its mention.

- Q: What are the essential folders we need to keep going forward in game development?

video2

- Video 2 covers more soft skills that are crucial for developers to work on; from keeping creativity & passion alive, potential challenges, to possible recovery routes out of burnout/problems, we learn to embrace a growth mindset not just for the sake of our work, but for the sake of our work being able to flourish as it's driven by the dev's mental space.

- Useful idea: Passion, specifically keeping it alive, is critical to determination & working through problems.

- Q: Considering the importance of keeping creativity intact, does working in teams hamper progress compared to working alone? Or does it aid creativity by reasoning of multiple influxes of creative ideas?

video3

1. How to set up project folders to create one + log work smoothly.

2. Keeping my notes all in one place & being able to track my work the same way.

3. Is there a specific way I should log my work?

video4

O: Using a template to blueprint my work, adding titles/captions + imagery, and overall demos a one-page design doc to show how well you're communicating a specific idea.

I: Sticking to a one-page design acts as a guideline for work & seems more intuitive.

Q: How do one-page designs work for teams?

video5

CS110 / INDEPENDENCE ROAD

O: Shows a clear step-by-step demonstration of how to navigate creation of a project in Unity, along with some shortcuts and an overall intro to the IDE of Unity.

I: Using Game View seems to be useful.

Q: When we go in Unity, there are many assets & folders created; are we supposed to upload every single one to GitHub? (I had trouble doing that before)

video6

O: How to import character models in 3D into Unity, prefab explanation.

I: For my project, I could try importing character models & practicing switching them out according to the video.

Q: How do I create a character model?

opinion

Beforehand, I only knew what I wanted the game to look like. Now, I want to start thinking of how I can potentially create character models, which might introduce interesting side-missions to the game (like adding kits). Additionally, trying out the one-page design method will definitely change the way I was originally planning on laying everything out.

questions

While I'm working solo, I first need to understand whether or not I should allocate more time toward learning the Unity fundamentals or on crafting a better story. I also need to figure out if it's okay that my game is derivative of Bedwars, as I may need to pivot/add something distinctive.

Whiteboard

1. Keeping a README file handy for a game overview.
2. Be mindful of maintaining a growth mindset because there WILL be hurdles.
3. Log every step/edit (makes for easier re-works later/Proper Planning Prevents Poor Performance).
4. One-page design to keep work/ideas all in one space.
5. Navigating Unity will be easier with learning shortcuts and gaining an intuition with the IDE.
6. Can import custom 3D players which might alter game direction.

= My game :-)

pitch

understand

Thus far, we've walked through a step-by-step lesson from what we must cultivate non-technically as developers--such as a growth mindset--to how to navigate Unity/the IDE we'll be working with.

offer

As a solo worker, I'll contribute everything: game idea, creating project file, logging work, importing assets, and keeping a personal GitHub repository for Week 12.

limits

I still need to develop an intuition with Unity. In my first attempt, I deleted most assets since it overloaded GitHub. Often times, it feels like I'm doing things wrong, so I need to start checking in with others regardless of working solo to make sure I'm on track.

tools

- Unity: building my game
- Git commands: track changes quickly
- GitHub: keep repository

aiTool

AI: Gemini

Task: Help me work through ambiguity and explain simple tools/functions necessary to my game.

Verification: Verifying through console output error messages & potentially running through another AI (like ChatGPT).
